Plate tectonics and subduction zones are responsible for the way Earth looks, driving the creation of continental plates and the basins that would fill to become oceans. They are also the primary control on the chemical characteristics of the planet's surface and are likely responsible for Earth's ability to sustain life.

The findings tell us about composition of the Earth's crust, but can't tell us exactly where it has gone over time. Understanding the motion of the crust is another clue to plate tectonics' origins. A second study, led by Harvard University geologist Alec Brenner and others, and published in April in Science Advances, tries to fill that gap.

Tectonics, scientific study of the deformation of the rocks that make up the Earth's crust and the forces that produce such deformation. It deals with the folding and faulting associated with mountain building; the large-scale, gradual upward and downward movements of the crust (epeirogenic movements); and sudden horizontal displacements along faults.
