Value Engineering: Refining the Design and Gearing up for Production Engineering Design for Manufacture and Assembly. Having been involved in the detail design of the product, the next stage is to gear up for production. This can be seen as two phases: Refining the design to ensure the product can be manufactured as economically and efficiently as possible. This is achieved through value engineering and design-for-manufacture and assembly techniques.

Value Engineering is a search-oriented philosophy which tests products for real value. The three-step problem-solving philosophy of Descartes (intuition, deduction and induction) is offered as ideally suited to problem-solving in Value Engineer ing.

VALUE ENGINEERING

Value Analysis (VA) is concerned with existing products. It involves a current product being analysed and evaluated by a team, to reduce costs, improve product function or both. Value Analysis exercises use a plan which step-by-step, methodically evaluates the product in a range of areas. These include costs, function, alternative components and design aspects such as ease of manufacture and assembly.

Value Engineering is based on analyzing the functions, process or service of a product to maximizing value principle. Providing function and quality at the minimum cost will have the product value maximized. VA is the term used when applied to existing products and VE when applier to new products. VE in NPD has evolved into 3 phases.
